Outline of the Revised Forecast of Results .................. (7)

Note: The Company's fiscal year (FY) is from April 1 to March 31 of the following year - FY2008 represents the fiscal year began in April 1, 2008, and ends in March 31, 2009.
Operation of Reactors No. 1 and No. 2 to be terminated,
Reactor No. 6 to be built in their replacement
A spent fuel dry storage facility to be built on the site
The Plans Overview (2)

December 2008

- Construction of Reactor No. 6
- Termination of operations at Reactors Nos. 1 & 2
- Construction of spent fuel dry storage facility

2018

- Operation to start 2018 and thereafter within several years (target)
- Planning for decommission procedures
- Geological survey
- Construction to begin
- Usage start FY 2016 (target)
Reactor No. 6 will be a 1,400MW-class Advanced Boiling Water Reactor (ABWR) similar to Reactor No. 5. The construction will be on the east side of Reactor No. 5. The company will acquire land needed to build the reactor. Under the plan, cooling water will be drawn in through an intake tower and seafloor tunnel that is to be built, the same as that of the arrangement used in other reactors.
The Shutdown of Reactors No. 1 and No. 2

Their operation are to be terminated, based on judgments which concluded that it would not be economical to perform needed work to restart them, as such will take considerable expense and time to achieve targeted seismic resistance (approx. 1,000 gal).

For the time being, the company will remove fuel from them, while planning for decommission procedures.

◆ Process of decommission

- Removal of fuel
- Initial decontamination
- Long term safe-storage
- Dismantle & removal of structures
- Disposal of waste

The company will make plans in detailed procedures and time frame.
Based on necessity to remove spent fuels from fuel pool in Reactors Nos. 1 and 2 which are to be shutdown, Chubu Electric has adopted a plan to build a new dry storage facility inside the power station site for spent fuel from all Hamaoka reactors as part of the current power generation facilities.

Storage capacity: approx. 700 tU (equivalent to approx. 4,000 fuel assemblies) The construction site will be north of Reactor No. 4, where is a land belongs to the power station.

For the time being, the company will conduct geological survey.

Spent fuel dry storage facility

At the spent fuel dry storage facility, spent fuel will be stored in special metal casks until it is removed to a reprocessing facility.

Metal cask

Approx. dimension 60m × 50m × (height) 25m
Nuclear Power Generation Ratio in Composition of Power Supply
(Based on Supply Plan for FY 2008)

Composition of generated electricity

Composition of generating facilities

Previous plan
※ Reactor No. 6 does not affect above figures, as its commencement of operation will be FY 2017 and thereafter

© 2008 Chubu Electric Power Co., Inc. All rights reserved.
An extraordinary loss of approximately 155 billion yen to be recorded in conjunction with shutdown of Reactors Nos. 1 and 2.

Principal figures on which outlooks are based are unchanged from previous announcement in October, 2008.

Although the company expects extremely severe outlook for incomes, the company plans to maintain year end dividends of 30 yen per share (60 yen per share for annual basis).

Outline of the Revised Forecast of Results
